Evidence of Contribution and Non-Contribution

Team 52 — Clue! (G6046 Software Engineering)

Prepared to support the final submission, peer assessment, and any follow-up questions about how the work was distributed across the group.

The purpose of this document is not to make personal criticisms, but to set out the available factual evidence regarding participation, communication, and submitted work. The evidence includes GitHub activity, meeting records, development documentation, direct messages, emails, and screenshots.

1. Summary

The final implementation, testing, documentation, and submission preparation were completed by Thanh Shaw. The remaining team members did not make identifiable contributions to the submitted codebase or written deliverables beyond limited meeting attendance and intermittent communication.

Where other team members indicated that they intended to contribute, this was not reflected in the submitted repository, the final document set, or the completed implementation.

2. Team Members

Name	Planned Role	Status
Thanh Shaw	Board/movement logic, GUI, testing, documentation	Primary contributor
Insik Ham	Project lead, cards/game logic, AI	Non-contributing
Omar Abu Isbeih	Testing and documentation	Non-contributing
Murat Maimaiti	TBC	Non-responding
Shengyuan Liu	TBC	Non-responding

3. Contribution Position

Thanh Shaw completed the substantial work of the project, including:

- Repository setup and project organisation
- Core model and board implementation
- Game flow and rules logic
- AI implementation and later AI corrections
- JavaFX GUI implementation
- Automated JUnit testing (90 tests)
- Manual gameplay testing
- Sprint documentation
- Testing documentation
- Design documentation
- Development log (72.5 hours recorded)
- Meeting notes consolidation
- Group report
- JavaDocs generation
- Final submission preparation

The other team members did not make any submitted contributions to the final codebase or final documentation set.

4. Communication and Participation Record

At the beginning of the project, attempts were made to contact all group members and arrange participation. Some members were non-responsive from the outset, while others communicated intermittently but did not follow through with completed work.

Meeting notes and message records show that:

- Repeated attempts were made to organise meetings and assign responsibilities.
- Some team members did not respond to messages for extended periods.
- Some planned meetings could not proceed fully because members were absent.
- Later assurances of contribution were not reflected in the final submitted work.

The screenshots below show email contact attempts made at the start of the project to establish communication with other group members:

Hi! I'm on your team (52) for the Software Engineering coursework. I'm trying to get a group chat started so we can coordinate and make a start—what platform do you usually prefer? (WhatsApp, Instagram, Discord, etc.)

Hi! Im not sure if you got my last message, but I'm on your team (52) for the Software Engineering coursework. I want to get a group chat started so we can coordinate and make a start—what platform do you prefer? (WhatsApp, Instagram, Discord, etc.)

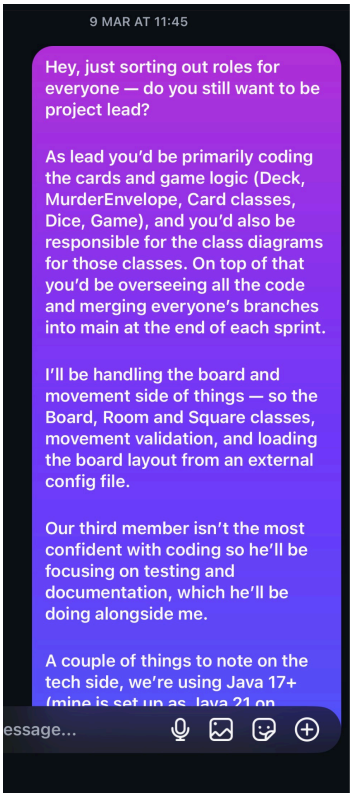
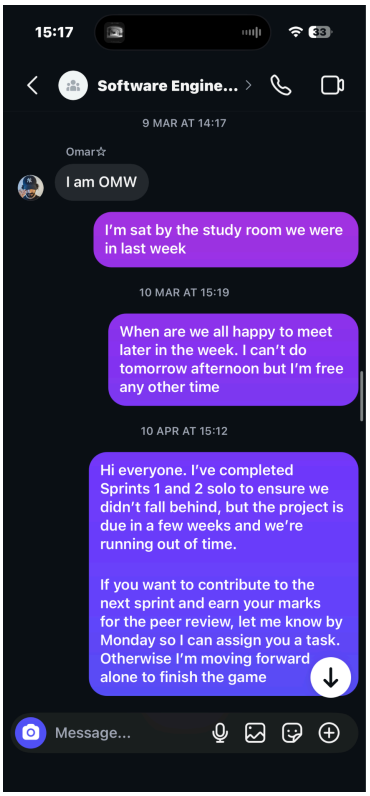
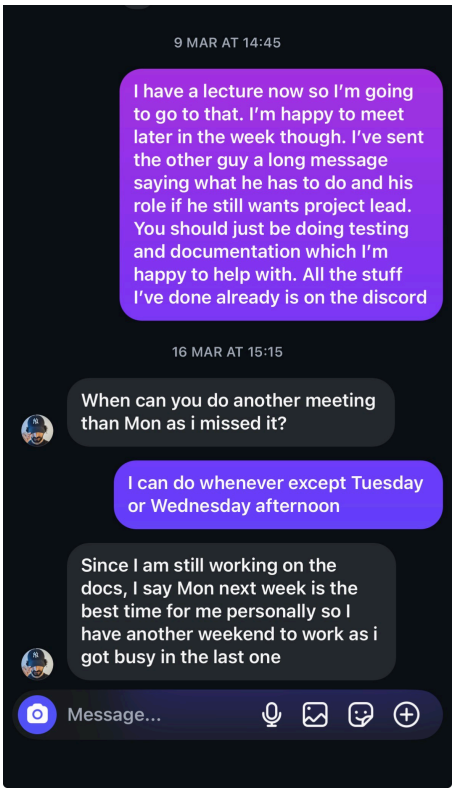
Hi, could you please join the Instagram group chat for the software engineering project? We need to make a start and want to hold our first meeting this week to assign roles and make a plan.
https://ig.me/j/AbZ9vm3v7zsH2r5F/

The screenshots below show messaging evidence from during the project:

- Screenshot 1: Message sent to Insik at the start of Sprint 1, no response received.
- Screenshot 2: Attempt to schedule a team meeting, no response received from most members. Omar indicated he was on his way but did not attend the previous meeting.
- Screenshot 3: Meeting cancelled after Omar did not show up, followed by no contact from him for approximately one week.



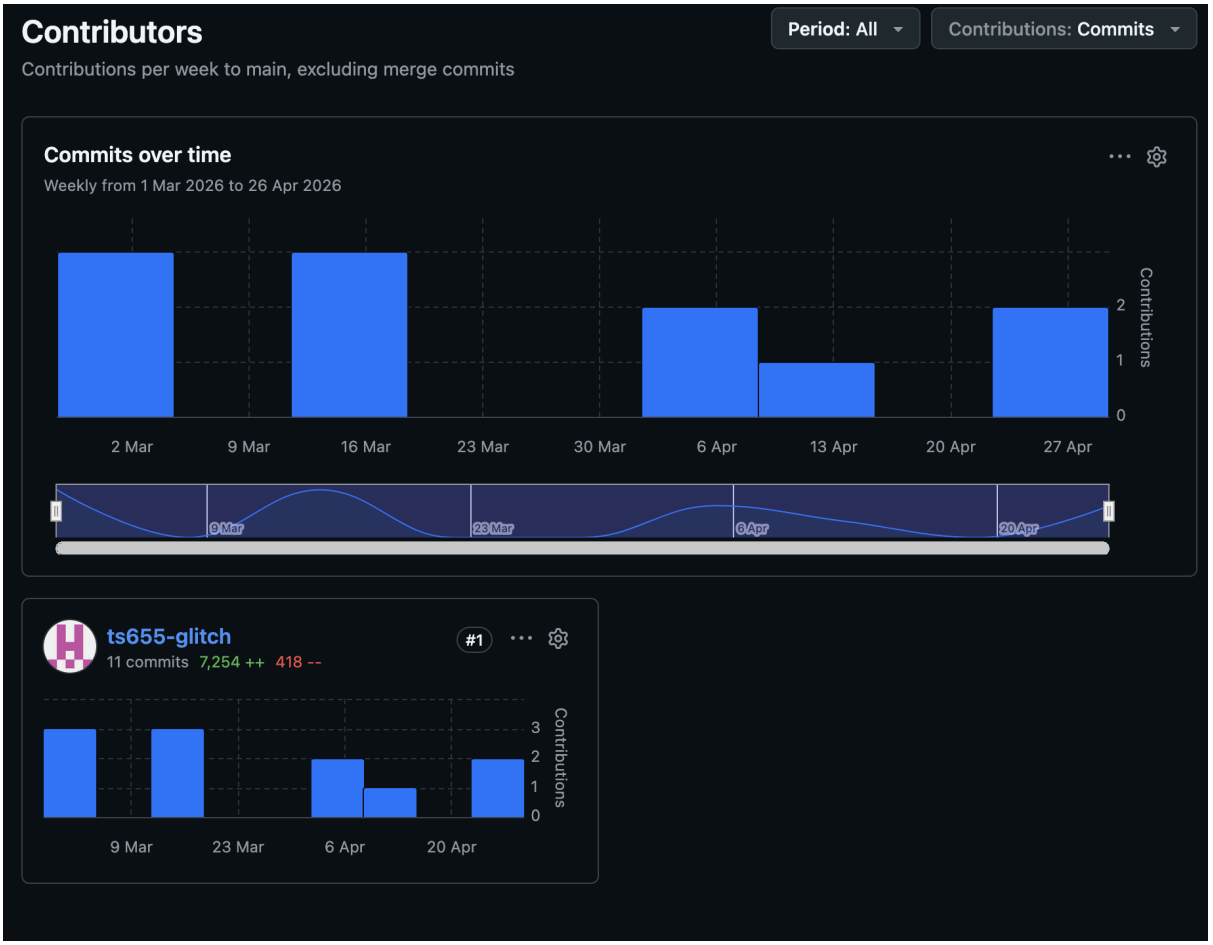


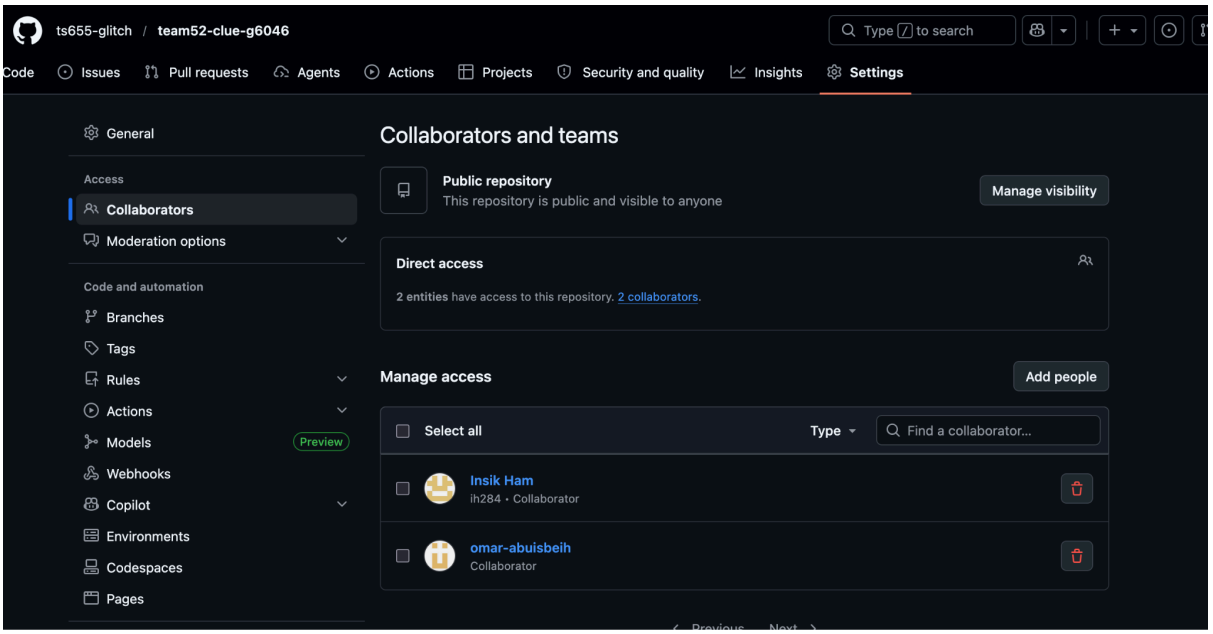


5. GitHub and Submitted Work

The submitted GitHub repository and final project files show that the implementation work was carried out by Thanh Shaw. This includes the main gameplay logic, GUI integration, testing, and final submission preparation.

Where other team members were added as collaborators or stated that they would contribute, this did not result in identifiable final code or documentation being incorporated into the submission.





6. Late Claimed Contributions

6.1 AI Player Code — Insik Ham

Near the end of the project, a late claim of contribution was made in relation to the AIPlayer class. The code was reviewed but was not suitable for inclusion in the final submission.

The main issue was that the implementation was weaker than the AI version already in the project. It used random movement rather than directed movement towards rooms, which meant the AI could wander without progressing through the game effectively. It also relied on less practical accusation logic, had weaker room-handling behaviour, and introduced tighter coupling between the AI and controller structure than the final implementation used.

Integrating the late code would not have improved the final system. It would have required additional reworking, re-testing, and documentation changes at a stage when the submission version had already been finalised. For that reason, the code was not merged into the final submission branch and did not form part of the submitted system.

The submitted AI code can be viewed at:

https://gist.github.com/ih284/164fa3cfcef597950ab0e5c40f9d6dfb

6.2 Late Supplementary Review — Omar Abu Isbeih

A late supplementary QA and documentation review was submitted after the main project materials had already been written and assembled into the submission pack. This review commented on the existing sprint documents, testing documentation, design documentation, planning materials, Gantt charts, and risk analysis, but it did not constitute production of those materials.

Repeated offers were made during the project to work collaboratively on documentation, but no completed testing or documentation work from Omar Abu Isbeih was incorporated into the final submission. Omar was assigned to the testing and documentation workstream rather than the main implementation work, and even on that basis no identifiable deliverables from him formed part of the submitted documentation set.

The points raised in the supplementary review did not materially alter the submission because they were already addressed in the existing documentation:

- The distinction between planned roles and actual completed contributions was already reflected across the project records. MeetingNotes.pdf records assigned roles, while Sprint1.pdf, Sprint2.pdf and Sprint3.pdf explain in their review sections that actual delivered contributions were uneven. GroupReport.pdf, Sections 3, 7 and 10, also distinguishes intended responsibilities from actual completed work.

- The move from four planned sprints to three delivered sprint phases was already explained. GroupReport.pdf, Section 3, and PlanningDocument.pdf, Sections 2 and 7, both explain the original four-sprint plan and how actual delivery differed from it. This is further supported by the planned and actual Gantt charts in docs/Planning.

- The external board configuration issue was already listed as an outstanding limitation. GroupReport.pdf, Section 8, explicitly states that the board is hard-coded and that loadFromFile() exists as a design provision but was not fully integrated into the startup flow.

- Manual GUI and system testing was already documented. TestingDocumentation.pdf, Sections 1, 2 and 7, explain that automated testing was supplemented by manual system testing and record the areas covered. GroupReport.pdf, Section 5, also covers this. The final submission video provided additional evidence.

- The project documentation does not present the team as having operated like an ideal Agile team. GroupReport.pdf, Sections 3, 7 and 10, and PlanningDocument.pdf, Section 7, all state clearly that participation was uneven and that most of the work was carried by one contributor.

- The risk material already identified materialised risks and mitigation. RiskAnalysis.pdf and PlanningDocument.pdf both cover this, including prioritisation of essential functionality, scope control, and the decision to delay JavaFX work until the core model was stable.

- The submission already stated that the AI and GUI were functional rather than highly advanced. GroupReport.pdf, Section 8, addresses both points explicitly.

The final testing and documentation workstream was completed by Thanh Shaw. This included the 90-test JUnit suite, requirements traceability, manual system testing record, sprint records, testing documentation, development log, and group report. A late review of those completed materials does not amount to having completed that workstream.

The supplementary review was acknowledged as late commentary on completed materials. It did not change the recorded contribution position.

7. Development Hours

The development log records 72.5 hours of work by Thanh Shaw across the full project timeline, covering every phase from initial project setup through to final submission preparation. No comparable record exists for any other team member.

Phase	Hours	Key Activity
Pre-sprint	4.5 hrs	Project setup, GitHub, class structure research
Sprint 1	15.5 hrs	Core classes, JUnit tests, sprint documentation
Sprint 2	17 hrs	Game loop, movement, suggestions, console prototype
Gap phase	2 hrs	Other coursework, team follow-up, TA meeting
Sprint 3	14 hrs	JavaFX GUI, dialogs, notebook, rules alignment
Final phase	19.5 hrs	Documentation, group report, submission preparation
Total	72.5 hrs	Full project from February to April 2026

8. Conclusion

Based on the available evidence, the final submitted project work was completed by Thanh Shaw. The remaining team members did not make any submitted contributions to the final codebase or documentation beyond limited meeting attendance and intermittent communication.

This document is intended to provide a factual record of that position, supported by communication evidence, meeting records, GitHub activity, and the final submission contents.
